

category	activity	unit	emission_f	source_na	source_dei	source_url	notes
electricity	Grid electr	kWh	0.675	Central Ele	CO2 Baseli	https://cei	Most current official Indian grid factor as of Sep 2026; CEA republishes annually (~Aug/Dec)
petrol_car	Petrol car	km	0.14	India GHG	India Speci	https://ind	Represents common hatchback segment (Swift/i20/Baleno-class). Other car sizes in same table range 0.103-0.289 kgCO2/km - swap in a different row if your form asks for car size/class
diesel_car	Diesel car	km	0.126	India GHG	India Speci	https://ind	Same source/table as petrol_car row above
bus	Intracity b	passenger	0.01516	India GHG	India Speci	https://ind	Paper explicitly states this does NOT apply to BRTS or intercity buses - intracity only
two_whee	Two-whee	km	0.0319	India GHG	India Speci	https://ind	Common commuter segment (Splendor/Discover-class). Scooters and other CC bands range 0.0290-0.0597 kgCO2/km in same table
lpg	LPG - dom	kg	2.939	UK DESNZ	Greenhous	https://ww	NOT YET VERIFIED against the exact 2026 edition cell (published 11 Jun 2026) - the number has not moved in 5 years so it's very unlikely to have changed, but Rohan should still open the 2026 flat file and confirm per the non-negotiable step. Standard Indian cylinder = 14.2 kg -> ~41.7 kgCO2e/full cylinder
domestic_f	Domestic f	passenger	0.2726	UK DESNZ	Greenhous	https://ww	HIGHEST PRIORITY row to re-verify - could only confirm this figure through the 2023 edition, not the current 2026 one, and flight factors move more than fuel factors do year to year. Open the 2026 flat file (Business travel - air tab, Domestic, WTT+RF, with-uplift row) before trusting this number
meat_meal	meat	meal	1.88	Scarborou	DERIVED fl	https://doi	as This row and veg_meal are the least directly sourced of the 9 - the /3-meals assumption needs the team's sign-off (or a better per-meal source) before you trust it in front of a reviewer
veg_meal		meal	1.27	Scarborou	DERIVED fl	https://doi	as Same caveat as meat_meal - fl not a cited statistic
